Domain-Specific Compilation and Benchmarks

- Build domain-specific code generators for use as a common infrastructure to report polyhedral optimizations and progresses on, instead of reporting just on polybench

Domain-Specific Compilation and Benchmarks

- Build domain-specific code generators for use as a common infrastructure to report polyhedral optimizations and progresses on, instead of reporting just on polybench
- A lot of lower-level building blocks (isl, cloog, osl, pet, pluto, pocc, pips, bee+cl@k, ...), but almost no use in high-level domain-specific compilers

Domain-Specific Compilation and Benchmarks

- Build domain-specific code generators for use as a common infrastructure to report polyhedral optimizations and progresses on, instead of reporting just on polybench
- A lot of lower-level building blocks (isl, cloog, osl, pet, pluto, pocc, pips, bee+cl@k, ...), but almost no use in high-level domain-specific compilers

- Include reference applications for such domains in polybench
